## Hydroxamic Acid Derivatives.

The present invention relates to therapeutically active hydroxamic acid and carboxylic acid derivatives, to processes for their preparation, to pharmaceutical compositions containing them, and to the use of such compounds in medicine. In particular, the compounds are inhibitors of metalloproteinases involved in tissue degradation, and in addition are inhibitors of the release of tumour necrosis factor from cells.

### Background to the Invention

Compounds which have the property of inhibiting the action of metalloproteinases involved in connective tissue breakdown such as collagenase, stromelysin and gelatinase (known as "matrix metalloproteinases", and herein referred to as MMPs) are thought to be potentially useful for the treatment or prophylaxis of conditions involving such tissue breakdown, for example rheumatoid arthritis, osteoarthritis, osteopenias such as osteoporosis, periodontitis, gingivitis, corneal epidermal or gastric ulceration, and tumour metastasis, invasion and growth.

Metalloproteinases are characterised by the presence in the structure of a zinc(II) ionic site. It is now known that there exists a range of metalloproteinase enzymes that includes fibroblast collagenase (Type 1), PMN-collagenase, 72 kDa-gelatinase, 92 kDa-gelatinase, stromelysin, stromelysin-2 and PUMP-1 (J.F. Woessner, FASEB J, 1991, 5, 2145-2154). Many known MMP inhibitors are peptide derivatives, based on naturally occurring amino acids, and are analogues of the cleavage site in the collagen molecule. A recent paper by Chapman et al J. Med. Chem. 1993, 36, 4293-4301 reports some general structure/activity findings in a series of N-carboxyalkyl peptides. Other known MMP inhibitors are less peptidic in structure, and may more properly be viewed as pseudopeptides or peptide mimetics. Such compounds usually having a functional group capable of binding to the zinc (II) site in the MMP, and known classes include those in which the zinc binding group is a hydroxamic acid, carboxylic acid, sulphhydryl, and oxygenated phosphorus (eg phosphinic acid and phosphonic acid) groups.

Two known classes of pseudopeptide or peptide mimetic MMP inhibitors have a hydroxamic acid group or a carboxylic acid group respectively as their zinc binding groups. With a few exceptions, such known MMPs may be represented by the structural formula (IA)

in which X is the zinc binding hydroxamic acid (-CONHOH) or carboxylic acid (-COOH) group and the groups R<sub>1</sub> to R<sub>5</sub> are variable in accordance with the specific prior art disclosures of such compounds. Examples of patent publications disclosing such structures are given below.

In such compounds, it is generally understood in the art that variation of the zinc binding group and the substituents R<sub>1</sub>, R<sub>2</sub> and R<sub>3</sub> can have an appreciable effect on the relative inhibition of the metalloproteinase enzymes. The group X is thought to interact with metalloproteinase enzymes by binding to a zinc(II) ion in the active site. Generally the hydroxamic acid group is preferred over the carboxylic acid group in terms of inhibitory activity against the various metalloproteinase enzymes. However, the carboxylic acid group in combination with other substituents can provide selective inhibition of gelatinase (EP-489,577-A). The R<sub>1</sub>, R<sub>2</sub> and R<sub>3</sub> groups are believed to occupy respectively the P1, P1' and P2' amino acid side chain binding sites for the natural enzyme substrate. There is evidence that a larger R<sub>1</sub> substituent can enhance activity against stromelysin, and that a (C<sub>1</sub>-C<sub>6</sub>)alkyl group (such as iso-butyl) at R<sub>2</sub> may be preferred for activity against collagenase whilst an alkylphenyl group (such as phenylpropyl) at R<sub>2</sub> may provide selectivity for gelatinase over the other metalloproteinases.

Pseudopeptide or peptide mimetic MMP inhibitors of formula (IA) with potent *in vitro*

activities are known, but are generally poorly absorbed following oral administration. Although, it is known that a number of factors can influence oral absorption (such as aqueous solubility, pKa, log P and molecular weight) the design of pseudopeptide enzyme inhibitors with high oral absorption is far from straightforward. Finding a combination of R<sub>1</sub>, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub> or R<sub>5</sub> substituents that permits a good balance of intrinsic level of activity, water solubility, oral absorption, and pharmacokinetic properties is a continuing problem in the art, since those properties can vary in an unpredictable way as the substituents R<sub>1</sub> - R<sub>5</sub> are varied. Identifying hydroxamic and carboxylic acid-based MMP inhibitors having such properties remains a much sought after goal in the art.

Tumour necrosis factor (herein referred to as "TNF") is a cytokine which is produced initially as a cell-associated 28kD precursor. It is released as an active, 17kD form, which can mediate a large number of deleterious effects in vivo. When administered to animals or humans it causes inflammation, fever, cardiovascular effects, haemorrhage, coagulation and acute phase responses, similar to those seen during acute infections and shock states. Chronic administration can also cause cachexia and anorexia. Accumulation of excessive TNF can be lethal.

There is considerable evidence from animal model studies that blocking the effects of TNF with specific antibodies can be beneficial in acute infections, shock states, graft versus host reactions and autoimmune disease. TNF is also an autocrine growth factor for some myelomas and lymphomas and can act to inhibit normal haematopoiesis in patients with these tumours.

Compounds which inhibit the production or action of TNF are therefore thought to be potentially useful for the treatment or prophylaxis of many inflammatory, infectious, immunological or malignant diseases. These include, but are not restricted to, septic shock, haemodynamic shock and sepsis syndrome, post ischaemic reperfusion injury, malaria, Crohn's disease, mycobacterial infection, meningitis, psoriasis, congestive heart failure, fibrotic disease, cachexia, graft rejection, cancer, autoimmune disease, rheumatoid arthritis, multiple sclerosis,

radiation damage, toxicity following administration of immunosuppressive monoclonal antibodies such as OKT3 or CAMPATH-1 and hyperoxic alveolar injury.

Since excessive TNF production has been noted in several diseases or conditions also characterised by MMP-mediated tissue degradation, compounds which inhibit both MMPs and TNF production may have particular advantages in the treatment or prophylaxis of diseases or conditions in which both mechanisms are involved.

Recently, WO 93/20047 disclosed a class of hydroxamic acid based MMP inhibitors which also are active in inhibiting TNF production.

As mentioned above MMP inhibitors have been proposed with hydroxamic acid or carboxylic acid zinc binding groups. The following patent publications disclose hydroxamic acid-based MMP inhibitors:

Salts of the compounds of the invention include physiologically acceptable acid addition salts for example hydrochlorides, hydrobromides, sulphates, methane sulphonates, p-toluenesulphonates, phosphates, acetates, citrates, succinates, lactates, tartrates, fumarates and maleates. Salts may also be formed with bases, for example sodium, potassium, magnesium, and calcium salts.

There are several chiral centres in the compounds according to the invention because of the presence of asymmetric carbon atoms. The presence of several asymmetric carbon atoms gives rise to a number of diastereomers with R or S stereochemistry at each chiral centre. General formula (I), and (unless specified otherwise) all other formulae in this specification are to be understood to include all

such stereoisomers and mixtures (for example racemic mixtures) thereof.

In the compounds of the invention, the preferred stereochemistry is in general as follows:

C atom carrying the  $R_1$  and X groups - S,

C atom carrying the  $R_2$  group - R,

C atom carrying the  $R_3$  group - S,

but mixtures in which the above configurations predominate are also contemplated.

The main invention-characterising feature of the compounds of the invention is the presence of the group  $R_6$  in at least one of the groups  $R_3$  and  $R_4$ . Otherwise in the compounds of the invention the definitions of the groups  $R_1$ - $R_5$  are based on groups known from the corresponding positions of known hydroxamic and carboxylic acid-based MMP inhibitors.

Thus, in the compounds of the invention:

$R_1$  may for example be hydrogen, methyl, ethyl, hydroxyl, allyl, or thienylmethylsulfonyl. Presently preferred are compounds in which  $R_1$  is hydrogen, hydroxyl or allyl.

$R_2$  may for example be a  $C_3$ - $C_8$  alkyl, cycloalkyl( $C_3$ - $C_6$  alkyl), phenyl( $C_2$ - $C_6$  alkyl),  $C_2$ - $C_4$  alkoxy( $C_1$ - $C_3$  alkyl)<sub>m</sub> or  $C_2$ - $C_4$  alkylsulphonyl( $C_1$ - $C_3$  alkyl)<sub>m</sub> group wherein m is 0 or 1. Examples of particular  $R_2$  groups include isobutyl, n-pentyl, n-hexyl, n-septyl, n-octyl, cyclohexylpropyl, cyclohexylbutyl, cyclohexylpentyl, phenylethyl, phenylpropyl, phenylbutyl, phenylpentyl, propyloxymethyl and propylsulphonyl. Presently preferred are compounds in which  $R_2$  is isobutyl.

(In those cases when  $R_3$  does not comprise a group  $R_6$ ) examples of suitable  $R_3$  groups include benzyl, iso-butyl and t-butyl. Presently preferred are

compounds in which  $R_3$  is benzyl or t-butyl. Presently most preferred are compounds in which  $R_3$  is t-butyl.

(In those cases when  $R_4$  does not comprise a group  $R_6$ )  $R_4$  may for example be  $C_1$ - $C_6$  alkyl,  $(C_1$ - $C_4$ )perfluoroalkyl or a group D- $(C_1$ - $C_6$  alkyl) wherein D represents hydroxy,  $(C_1$ - $C_6$ )alkoxy,  $(C_1$ - $C_6$ )alkylthio, acylamino, optionally substituted phenyl or heteroaryl. Examples of particular  $R_4$  groups include methyl, ethyl, propyl, butyl, hydroxyethyl, hydroxypropyl, 2,2-dimethyl-3-hydroxypropyl, hydroxybutyl, methoxyethyl, ethoxyethyl, methoxypropyl, 2,2-dimethyl-3-methoxypropyl, 2,2-dimethyl-3-ethoxypropyl, 2-ethylthioethyl, 2-acetoxyethyl, N-acetyl-aminoethyl, 3-(2-pyrrolidone)propyl, optionally substituted phenylethyl, phenylpropyl, phenylbutyl and phenylpentyl. Presently preferred are compounds in which  $R_4$  is methyl, t-butyl or benzyl. Presently most preferred are compounds in which  $R_4$  is methyl.

$R_5$  may for example be hydrogen, methyl or ethyl. Presently preferred are compounds in which  $R_5$  is hydrogen.

Interesting compounds of the invention include:

[4-(N-Hydroxyamino)-2R-isobutylsuccinyl]-L-phenylalaninyl-glycinyl-N-(2-acetamido-2-deoxy- $\beta$ -D-glucopyranosyl)-amide;

[4-(N-Hydroxyamino)-2R-isobutylsuccinyl]-L-phenylalaninyl-glycinyl-glycinyl-N-(2-acetamido-2-deoxy- $\beta$ -D-glucopyranosyl)-amide;

[4-(N-Hydroxyamino)-2R-isobutylsuccinyl]-O-[(2-acetamido-2-deoxy- $\beta$ -D-glucopyranosyl)carboxamidomethyl]-L-tyrosine-N-methylamide;

3S-Hydroxy-4-(N-hydroxyamino)-2R-isobutylsuccinyl-L-phenylalaninyl-glycinyl-N-(2-acetamido-2-deoxy- $\beta$ -D-glucopyranosyl)-amide;

and salts, solvates and hydrates thereof.

A compound of the invention which is especially preferred for its potency in inhibiting the production of TNF is:

[3S-Allyl-4-(N-hydroxyamino)-2R-isobutylsuccinyl]-N<sup>4</sup>-(2-acetamido-2-deoxy- $\alpha$ -D-glucopyranosyl)-L-glutamine-N-methylamide

and salts, solvates and hydrates thereof.

Compounds according to the present invention in which X is a hydroxamic acid group (-CONHOH) may be prepared from compounds of the invention in which X is a carboxylic acid group (-COOH). That process, which forms another aspect of the invention, comprises:

- (a) coupling an acid of general formula (III)

or an activated derivative thereof with hydroxylamine, O-protected hydroxylamine, or a salt thereof, R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, and R<sub>5</sub> being as defined in general formula (I) except that any substituents in R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, and R<sub>5</sub> which are potentially reactive with hydroxylamine, O-protected hydroxylamine or their salts may themselves be protected from such reaction, then removing any protecting groups from the resultant hydroxamic acid moiety and from any protected substituents in R<sub>2</sub>, R<sub>3</sub>, R<sub>4</sub>, and R<sub>5</sub>; and

- (b) optionally converting a compound of general formula (I) into another compound of general formula (I).

Conversion of (III) to an activated intermediate such as the pentafluorophenyl, hydroxysuccinyl, or hydroxybenzotriazolyl ester may be effected by reaction with the appropriate alcohol in the presence of a dehydrating agent such as dicyclohexyl dicarbodiimide (DCC), N,N-dimethylaminopropyl-N'-ethyl carbodiimide (EDC), or 2-ethoxy-1-ethoxycarbonyl-1,2-dihydroquinoline (EEDQ).

Protecting groups as referred to above are well known per se, for example from the techniques of peptide chemistry. Amino groups are often protectable by benzyloxycarbonyl, tert-butoxycarbonyl or acetyl groups, or in the form of a phthalimido group. Hydroxy groups, for example those hydroxy groups in the group  $R_6$  of the compounds of the invention, may be protected in the above process as readily cleavable ethers such as the tert-butyl or benzyl ether, or as readily cleavable esters such as the acetate. Carboxy groups are often protectable as readily cleavable esters, such as the tert-butyl or benzyl ester.

Compounds of formula (I) above in which the hydroxy groups in the group  $R_6$  are protected, for example as the acetate derivatives, are useful intermediates in the preparation of compounds of the invention.

In the special case where  $R_1$  in compound (I) is hydroxy, it too may be protected during the coupling of acid (III) with hydroxylamine. In that case a particularly useful technique may be simultaneous protection of the hydroxy group  $R_1$  and the adjacent carboxyl group as a dioxalone of formula (IV):

wherein the groups  $R_{12}$  and  $R_{13}$  are derived from a dioxalone forming reagent, and may be, for example, hydrogen, alkyl, phenyl or substituted phenyl. The dioxalone

ring being is opened on reaction with hydroxylamine to give the required hydroxamic acid derivative of formula (I).

Compounds according to the present invention in which X is a carboxylic acid group -COOH may be prepared by a process comprising: coupling an acid of formula (V) or an activated derivative thereof with an amine of formula (VI)

wherein  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ , and  $R_5$  are as defined in general formula (I) except that any substituents in  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ , and  $R_5$  which are potentially reactive in the coupling reaction may themselves be protected from such reaction, and  $R_{11}$  represents a hydroxy protecting group, and subsequently removing the protecting group  $R_{11}$  and any protecting groups from  $R_1$ ,  $R_2$ ,  $R_3$ ,  $R_4$ , and  $R_5$ .

Active derivatives of acids (V) include activated esters such as the pentafluorophenyl ester, acid anhydrides and acid halides, eg chlorides. Suitable hydroxy protecting groups may be selected from those known in the art.

In the special case where  $R_1$  in compound (V) is hydroxy, it too may be protected during the coupling of compounds (V) and (VI). In that case a particularly useful technique may be simultaneous protection of the two hydroxy groups as a dioxalane of formula (VII):

wherein the groups  $R_{12}$  and  $R_{13}$  are derived from a dioxalone forming reagent, and may be, for example, hydrogen, alkyl, phenyl or substituted phenyl.

As mentioned above, compounds of formula (I) are useful in human or veterinary medicine since they are active as inhibitors of MMPs, and a further advantage lies in their ability to inhibit the release of tumour necrosis factor (TNF) from cells.

Accordingly in another aspect, this invention concerns:

- (i) a method of management (by which is meant treatment or prophylaxis) of diseases or conditions mediated by MMPs and/or TNF in mammals, in particular in humans, which method comprises administering to the mammal an effective amount of a compound as defined with respect to formula (I) above, or a pharmaceutically acceptable salt thereof; and
- (ii) a compound as defined with respect to formula (I) for use in human or veterinary medicine, particularly in the management (by which is meant treatment or prophylaxis) of diseases or conditions mediated by MMPs and/or TNF; and
- (iii) the use of a compound as defined with respect to formula (I) in the preparation of an agent for the management (by which is meant treatment or prophylaxis) of diseases or conditions mediated by MMPs and/or TNF.

Diseases or conditions mediated by MMPs include those involving tissue breakdown such as bone resorption, inflammatory diseases, dermatological conditions and tumour invasion by secondary metastases, in particular rheumatoid arthritis, osteoarthritis, periodontitis, gingivitis, corneal ulceration and tumour invasion by secondary metastases. Diseases or conditions mediated by TNF include inflammation, fever, cardiovascular effects, haemorrhage, coagulation and acute phase response, cachexia and anorexia, acute infections, shock states, graft versus host reactions and autoimmune disease.

In a further aspect of the invention there is provided a pharmaceutical or veterinary composition comprising a compound of formula (I) together with a pharmaceutically or veterinarily acceptable excipient or carrier. In view of the oral bioavailability advantages of compounds in accordance with the invention, a further aspect of the invention comprises a pharmaceutical or veterinary composition comprising a compound of formula (I) together with a pharmaceutically or veterinarily acceptable excipient or carrier, characterised in that the composition is adapted for oral administration.

One or more compounds of general formula (I) may be present in the composition together with one or more excipient or carrier.

The compounds with which the invention is concerned may be prepared for administration by any route consistent with their pharmacokinetic properties. The orally administrable compositions may be in the form of tablets, capsules, powders, granules, lozenges, liquid or gel preparations, such as oral, topical, or sterile parenteral solutions or suspensions. Tablets and capsules for oral administration may be in unit dose presentation form, and may contain conventional excipients such as binding agents, for example syrup, acacia, gelatin, sorbitol, tragacanth, or polyvinyl-pyrrolidone; fillers for example lactose, sugar, maize-starch, calcium phosphate, sorbitol or glycine; tableting lubricant, for example magnesium stearate, talc, polyethylene glycol or silica; disintegrants for example potato starch, or acceptable wetting agents such as sodium lauryl sulphate. The tablets may be coated according to methods well known in normal pharmaceutical practice. Oral liquid preparations may be in the form of, for example, aqueous or oily suspensions, solutions, emulsions, syrups or elixirs, or may be presented as a dry product for reconstitution with water or other suitable vehicle before use. Such liquid preparations may contain conventional additives such as suspending agents, for example sorbitol, syrup, methyl cellulose, glucose syrup, gelatin hydrogenated edible fats; emulsifying agents, for example lecithin, sorbitan monooleate, or acacia; non-aqueous vehicles (which may include edible oils), for

example almond oil, fractionated coconut oil, oily esters such as glycerine, propylene glycol, or ethyl alcohol; preservatives, for example methyl or propyl p-hydroxybenzoate or sorbic acid, and if desired conventional flavouring or colouring agents.

The dosage unit involved in oral administration may contain from about 1 to 250mg, preferably from about 25 to 250mg of a compound of the invention. A suitable daily dose for a mammal may vary widely depending on the condition of the patient. However, a dose of a compound of general formula I of about 0.1 to 300mg/kg body weight, particularly from about 1 to 100mg/kg body weight may be appropriate.

For topical application to the skin, the drug may be made up into a cream, lotion or ointment. Cream or ointment formulations which may be used for the drug are conventional formulations well known in the art, for example as described in standard textbooks of pharmaceuticals such as the British Pharmacopoeia.

For topical application to the eye, the drug may be made up into a solution or suspension in a suitable sterile aqueous or non aqueous vehicle. Additives, for instance buffers such as sodium metabisulphite or disodium edeate; preservatives including bactericidal and fungicidal agents such as phenyl mercuric acetate or nitrate, benzalkonium chloride or chlorhexidine, and thickening agents such as hypromellose may also be included.

The dosage for topical administration will of course depend on the size of the area being treated. For the eyes, each dose may typically be in the range from 10 to 100mg of the drug.

The active ingredient may also be administered parenterally in a sterile medium. Depending on the vehicle and concentration used, the drug can either be suspended or dissolved in the vehicle. Advantageously, adjuvants such as a local anaesthetic, preservative and buffering agents can be dissolved in the vehicle.

For use in the treatment of rheumatoid arthritis, the drug can be administered by the oral route or by injection intra-articularly into the affected joint. The daily dosage for a 70kg mammal may be in the range 10mgs to 1gram.

#### Biological Example B

The ability of example compounds of the invention to inhibit the release of TNF was investigated. The assay is based on the ability of phorbol myristate acetate (PMA) to stimulate the release of TNF  $\alpha$  from a human monocytic cell line, U937.

U937 cells cultured in RPMI 1640 medium + 5% foetal calf serum are centrifuged at 1000 x g for 5 minutes and then resuspended in medium at  $2 \times 10^6$  / ml. 1 ml of cell suspension is aliquoted into individual wells of 24-well plates. Test compounds are dissolved in dimethyl sulphoxide (DMSO) at a stock concentration of 100mM, then diluted to 50x the final required concentration with RPMI 1640 medium. 20 $\mu$ l of the diluted compounds are added to U937 cells in duplicate wells. TNF  $\alpha$  release is stimulated by addition of PMA to the cells at a final concentration of 50nM. Appropriate control cultures are set up in duplicate. The plates are incubated for 18 hours at 37°C,

5% CO<sub>2</sub>, then centrifuged at 1000 x g for 5 minutes. A specific ELISA for TNF  $\alpha$  obtained from R&D Systems Europe Ltd, Abingdon, England is used to measure TNF  $\alpha$  levels in the culture supernatants

The average concentration of test compound which inhibits the release of TNF  $\alpha$  by 50% relative to the control culture was assessed. The compound of example 5 above had IC<sub>50</sub> value less than 3.5  $\mu$ M.  $\mu$ M.

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 17, 21-24  
because they relate to subject matter not required to be searched by this Authority, namely:  
Remark: Although claims 17 and 21 to 24 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
